

Jellybeats Login/Sign up Form

I'm looking for a cost to program a current form. The form and site are already designed and completed. This job is for programming the function for stage one. I've had 2 programmers who said they could do this, both fail miserably. Please only commit to this job if you are a full-stack back end programmer who understands and is highly experienced.

The site speed is important; currently, loads in less than half a second; maintaining the site load speed is imperative and must not be affected by any programming or coding. Loading speed must be maintained at all times. The site default theme is HTML (Bootstrap), and should not be changed.

Note: Once the form is complete, everything should be checked to ensure it functions as intended. When programming, delays, or mishaps caused by the programmer means they responsible for fixing these issues. Issues should be rectified as per the original quote, preferably within the time frame. Upon completion, our side will then run intense tests for the implementation and integrity of code. We do this for the security and stability of the login/sign and programming. We do this is to ensure all user account is 100% secured.

If this is something you can do, please advise as i would like to commence soon. Below is the first stage of the project.

Stage one.

A. The [landing page](#) is where an unregistered user who visits the site is directed.

B. A user will have to sign up for a free account or a pro account to access the site (Home page). Once signed in, the default page is the [home page](#).

C. When users create a new account, they need to confirm the account by clicking a link they receive to there mailbox.

D. Set up of Google and Facebook API for quick user sign-up and login.

E. Once a user has successfully logged in, they will stay logged in. The only way they can log out is when they choose to log out manually.

F. When a user is logged in, they will not be able to visit the landing page. When a user has logged out, the landing page is all they can visit until they log in again.

G. There will also need to be a way to restore a lost password.

H. Programming of logins will require high-security features, no third party copying, and cheap codes. It must be written with the highest security integrity as a requirement.

I. every time a new user signs in, they are directed to a fresh account new account.

J. From requires PHP & firebase as the database also with AJAX Libraries API.

Finally

The site and form have already been built and are currently undertaking ongoing work for design purposes. This quote is only for programming to make the form fully functional. Form and site login speed should not be compromised. Loading must stay under 1/2 second. Create a free account here <https://audiomack.com/> or here <https://soundcloud.com/discover> and see how incredibly stable, fast, accurate, and efficient these login/signups are. That's the quality I'm looking at matching.

Experience required

Full-Stack developer/programmer with experience in programming signup login forms such as <https://audiomack.com/> or here <https://soundcloud.com/discover>

I look forward to your quote.

Regards
Ferris A
